Improving Water Use Efficiency in Silage Production

Wednesday, Sept 8th, 2021
2 pm - 2:30 pm Mountain,
followed by Q & A

Todd Ballard, PhD
Golden Plains
Extension
Agronomist, CSU

Colorado's growing dairy industry creates a demand for silage production. A complete animal production system starts with the plants that feed them. Currently the most common source of this silage is corn. Reducing the stress on limited water resources requires development a more water use efficient silage production system. Forage sorghum can be part of that system.
